Kakis AI Platform Documentation

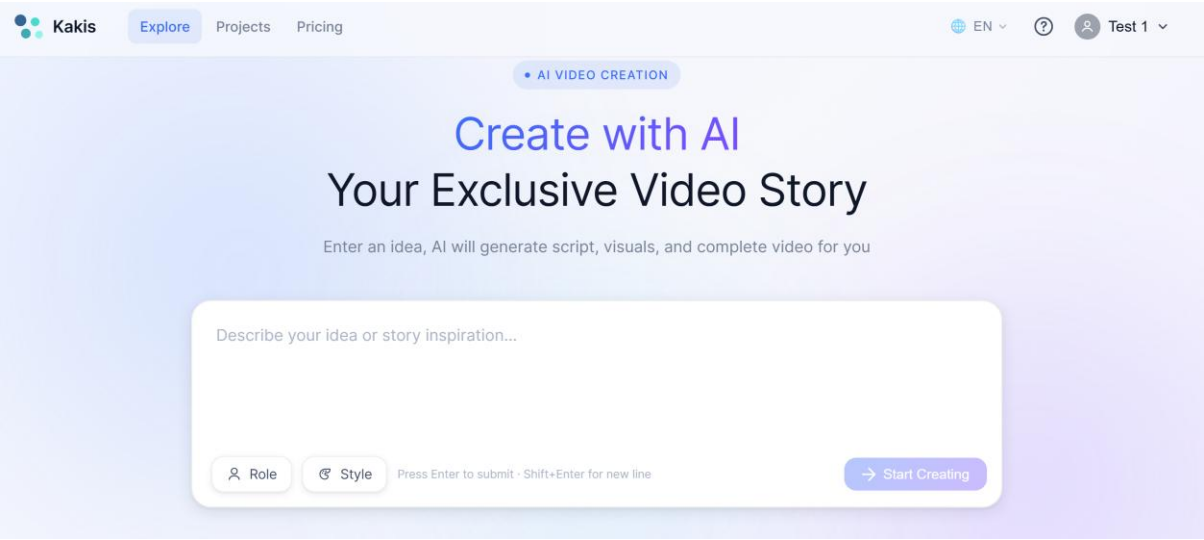
Introduction

Welcome to Kakis AI, an innovative platform designed to streamline video creation through artificial intelligence. This documentation provides a comprehensive guide to navigating and utilising the platform's features, from initial idea generation to final video export. Kakis AI empowers you to transform text prompts into engaging video stories with customizable roles, styles, and scene management.

Getting Started: Creating Your Exclusive Video Story

1. Idea Generation

Upon landing on the Kakis AI homepage, you are presented with a prompt box to enter your story idea or inspiration. This serves as the foundation for the AI to generate the video script and visuals.



2. Role and Style Selection

Before initiating the creation process, you have the option to define the aesthetic and character elements of their video:

- **Role**: Click the "Role" button to access the **Role Library**. Here, you can select from a variety of pre-defined characters or create new ones. This feature allows for detailed customisation of character appearance and attributes, influencing the visual output of the video.

- **Style**: The "Style" button opens the **Style Library**, offering diverse visual themes such as "Classic Cinema," "New Wuxia Atmosphere," and "New 3D Modern." Choosing a style dictates the overall visual tone and artistic direction of the generated video.

3. Quick Start with Example Prompts

For you seeking inspiration or a quick start, Kakis AI provides several **example prompts** directly on the homepage. These include scenarios like "A cyberpunk detective chasing data ghosts in neon rain" or "Time traveller preventing historical disasters." Clicking on any of these examples automatically populates the prompt box with the selected prompt.

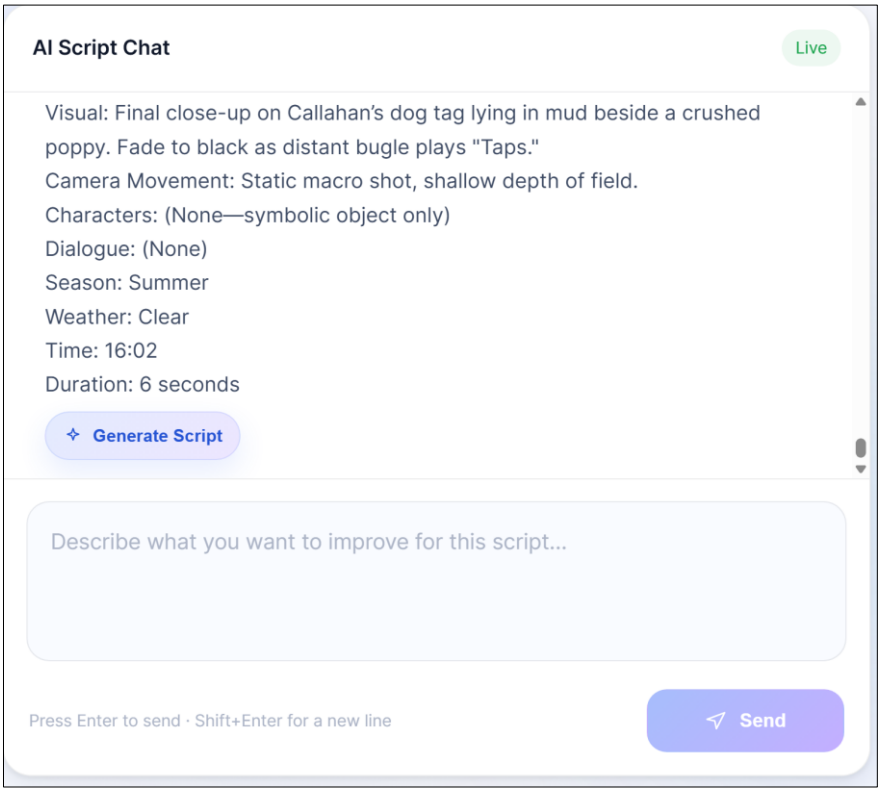
4. Initiating Video Creation

Once the story idea is entered and any desired roles or styles are selected, click the "Start Creating" button. This action initiates the AI-driven process of script generation and prepares the platform for further customisation.

Advanced Features: Scripting and Asset Management

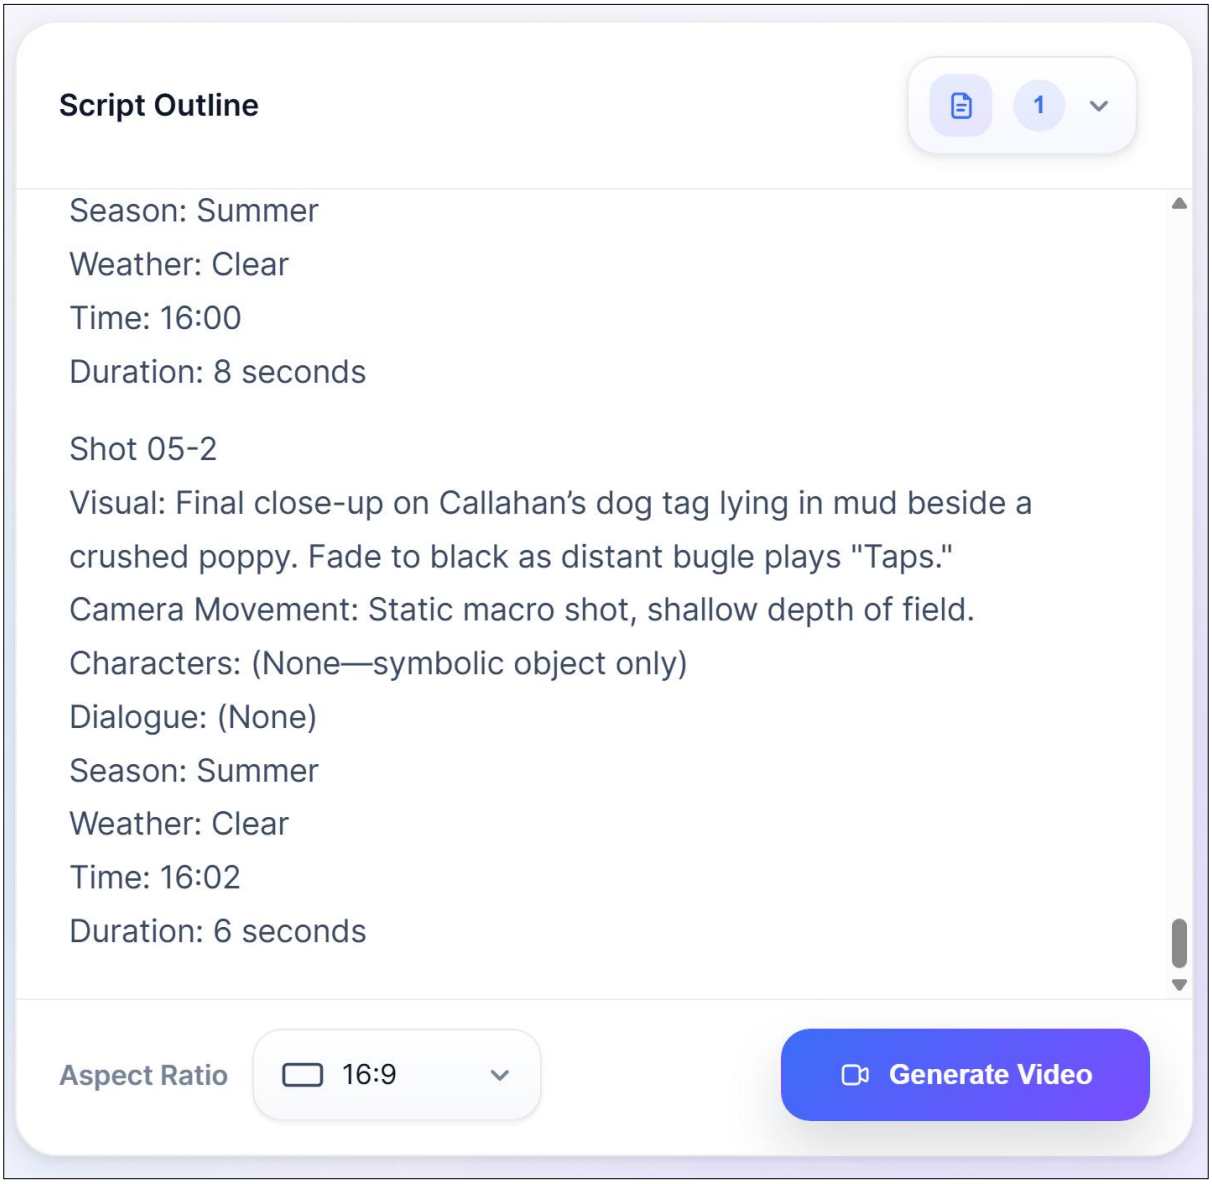
1. AI Script Chat

After the initial prompt, you are directed to the **AI Script Chat** interface. This interactive feature allows for multi-round conversations with the AI to refine and develop the video script. You can provide feedback and instructions to iteratively improve the narrative, dialogue, and scene descriptions.



2. Script Outline and Aspect Ratio

Once you are satisfied with the script, you can click, and the detailed outline will show up on the right. The refined script is presented as a **Script Outline**, providing a structured overview of the video's narrative flow. You can also select the desired **Aspect Ratio** for their video (e.g., 16:9), ensuring compatibility with various viewing platforms.

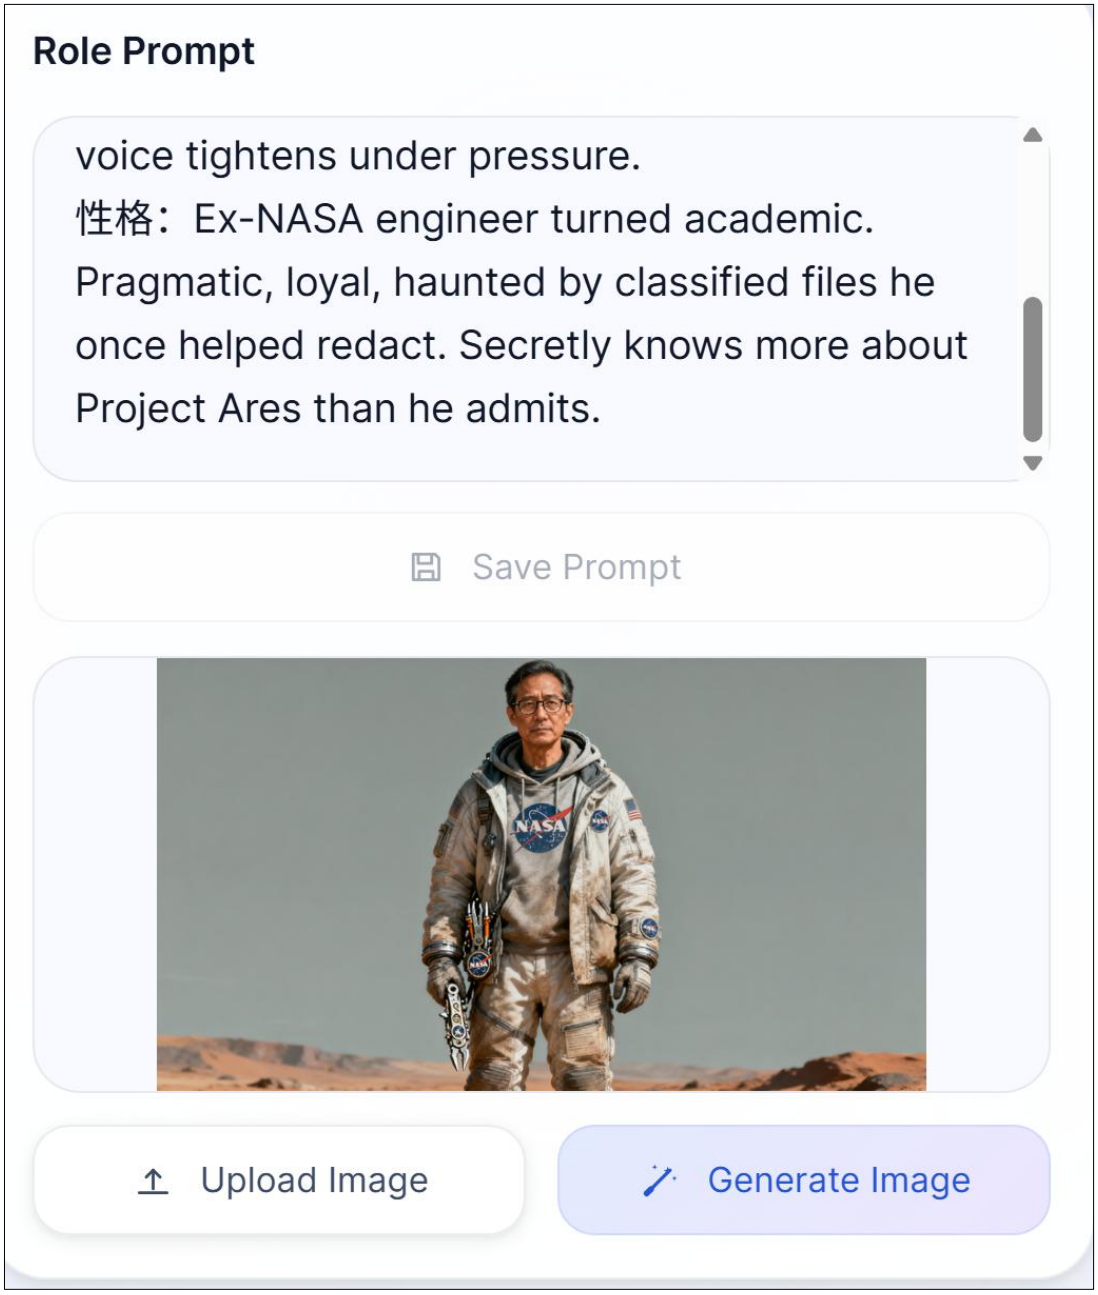


3. Asset Management and Editing

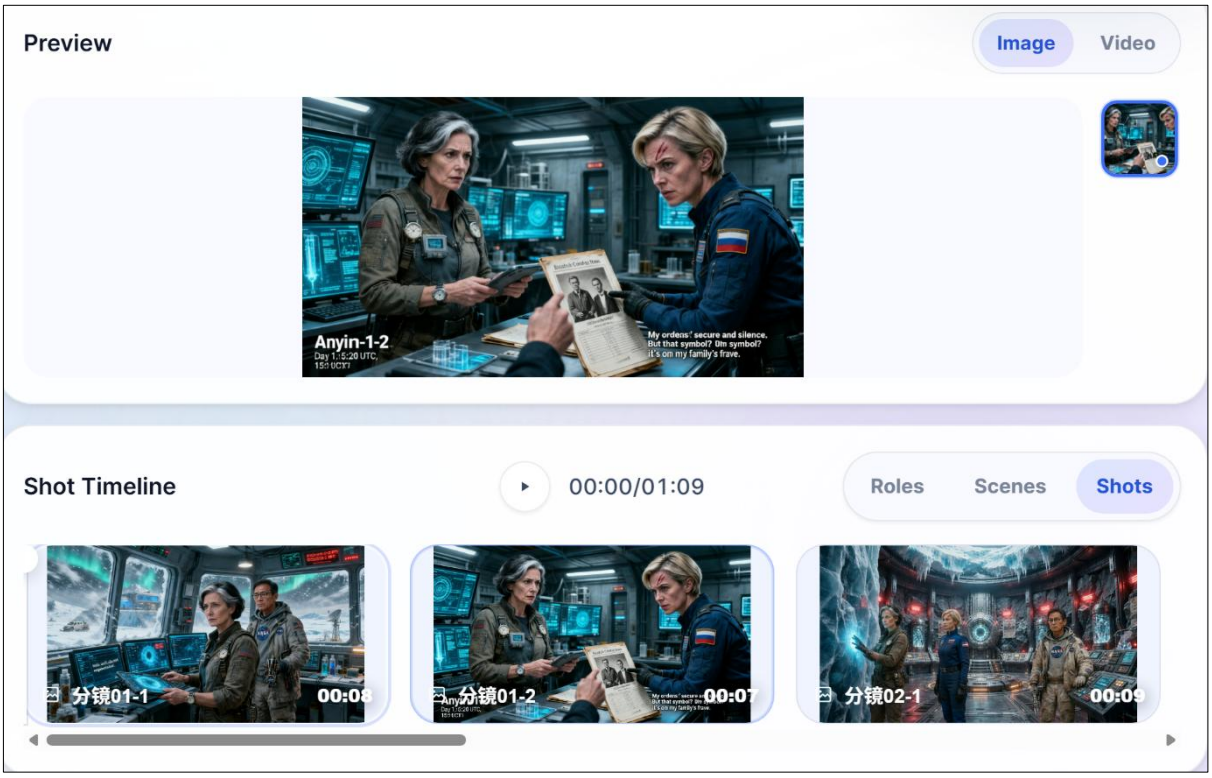
The platform offers granular control over individual video assets through a dedicated editing interface:

- **Role Prompting**: Within this section, you can further edit specific prompts for each character (Role) to fine-tune their appearance, actions, and expressions within the

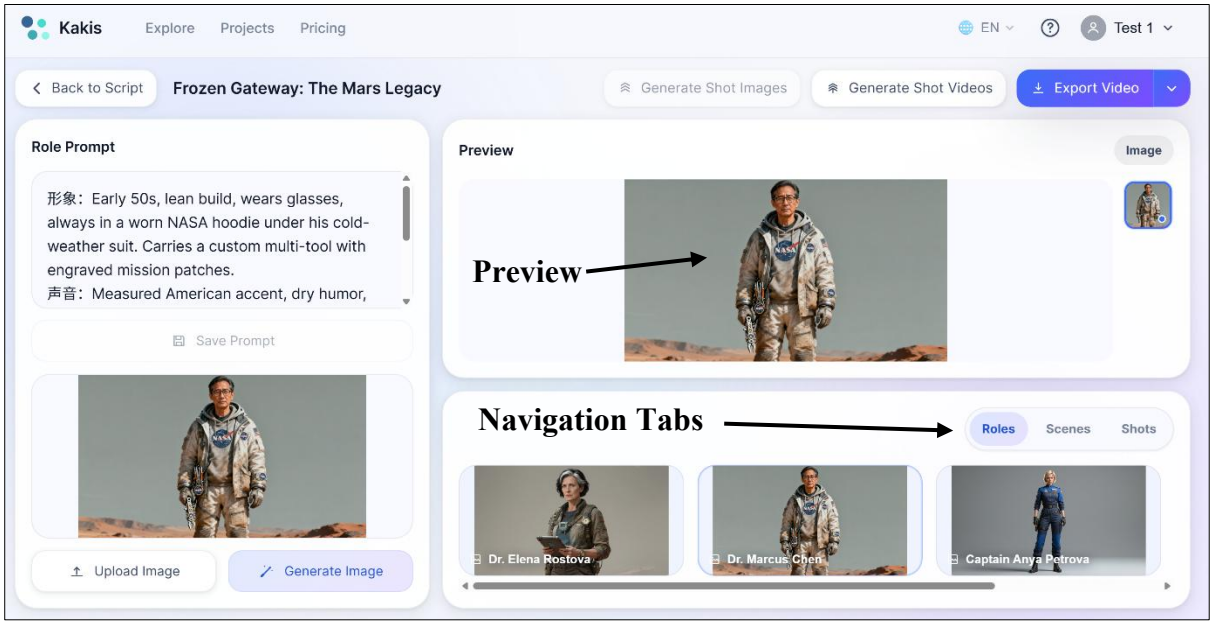
video. This allows for precise control over character portrayal. Same can be done for scenes and shots. Just navigate to them.



- **Shot Timeline**: A visual **Shot Timeline** displays all individual shots that comprise the video. This timeline is crucial for organising and reviewing the sequence of events.

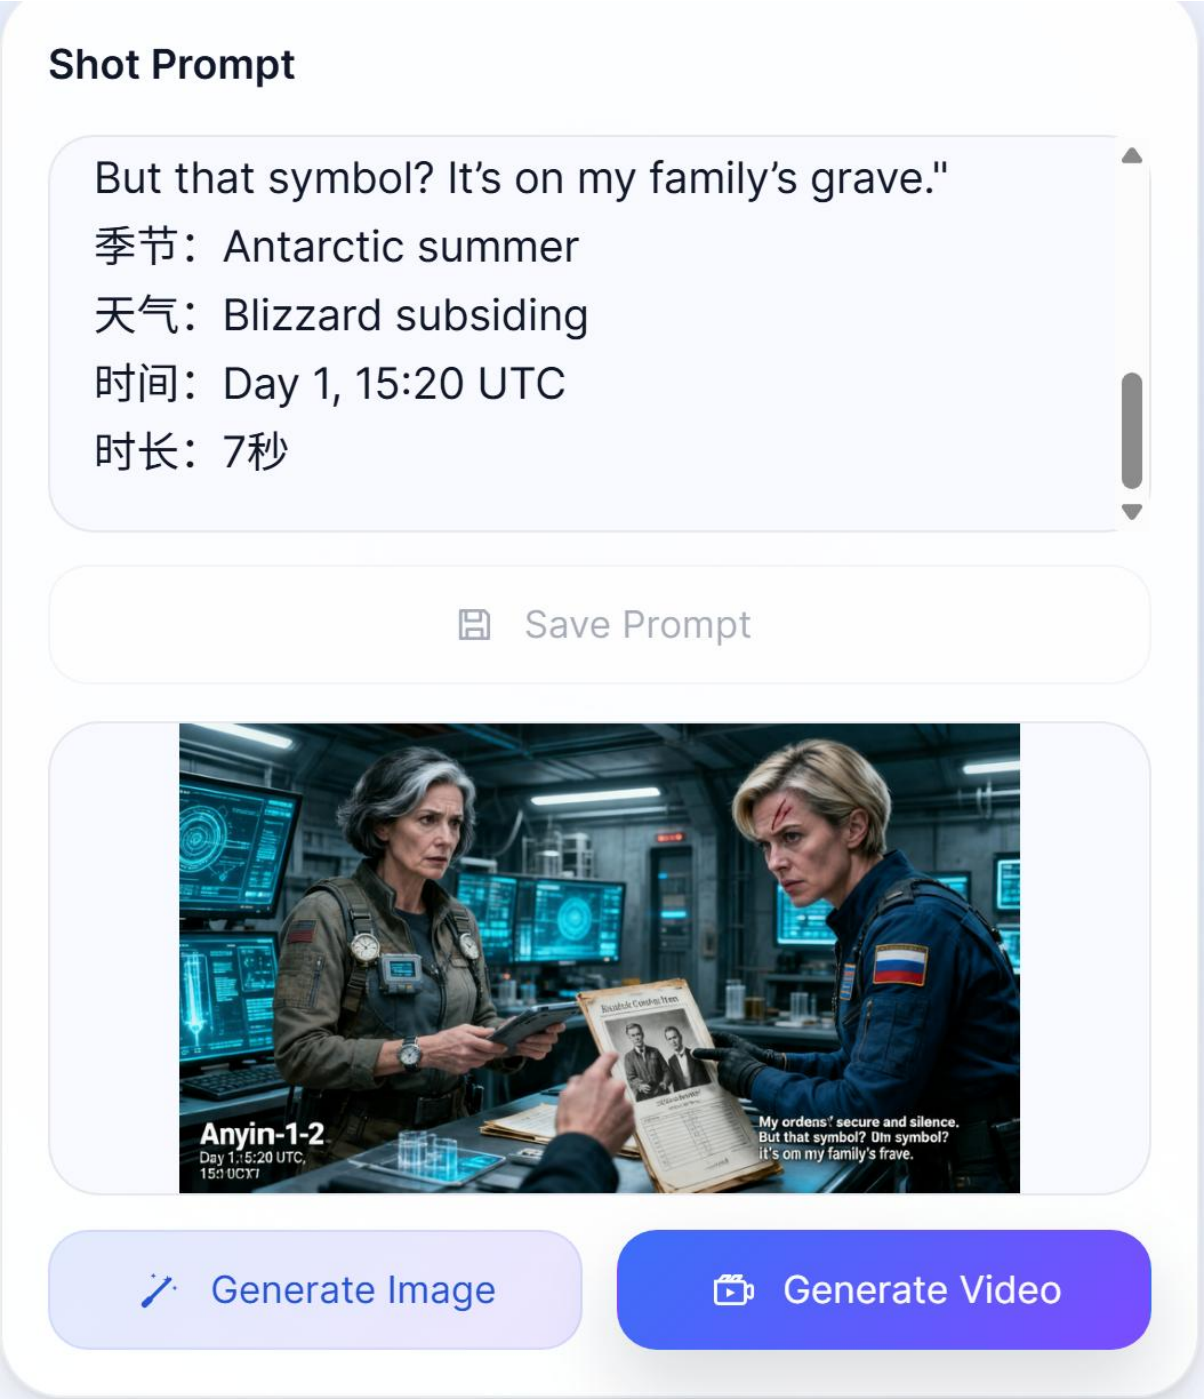


- **Navigation Tabs**: You can easily switch between different management views using the "Roles," "Scenes," and "Shots" tabs. This enables focused editing on specific elements of the video production.
-



- **Preview**: A **Preview** window is available to review generated images or short video clips for each shot, allowing for immediate visual feedback on changes. You can also upload your own via the “Upload Image” button here.

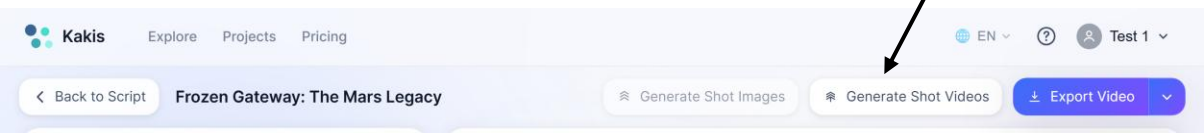
- **Generate Image/Video**: Buttons to "Generate Image" or "Generate Video" allow you to create or re-generate visual assets for individual shots based on updated prompts or styles.



Finalisation and Export

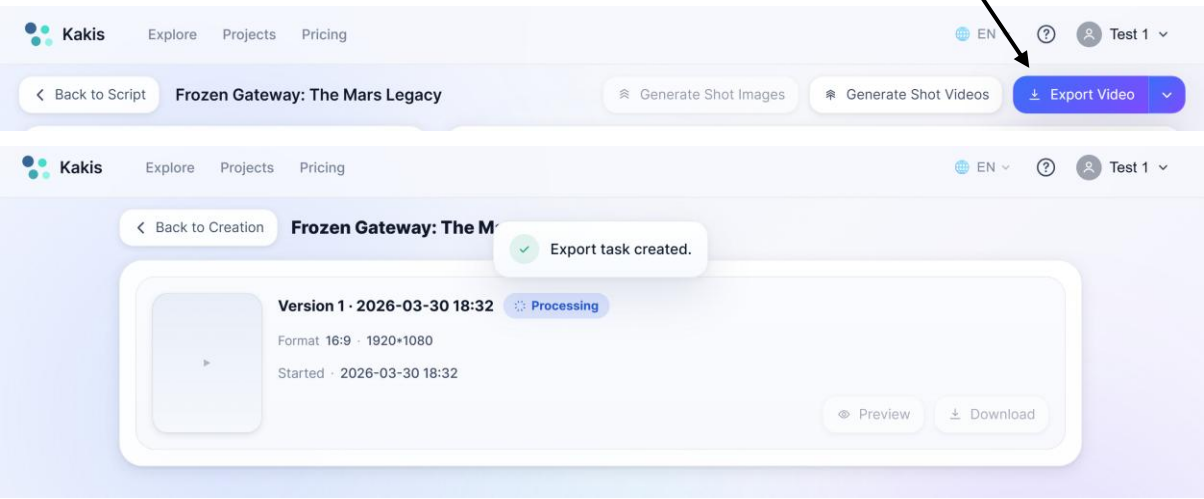
1. Generating All Videos

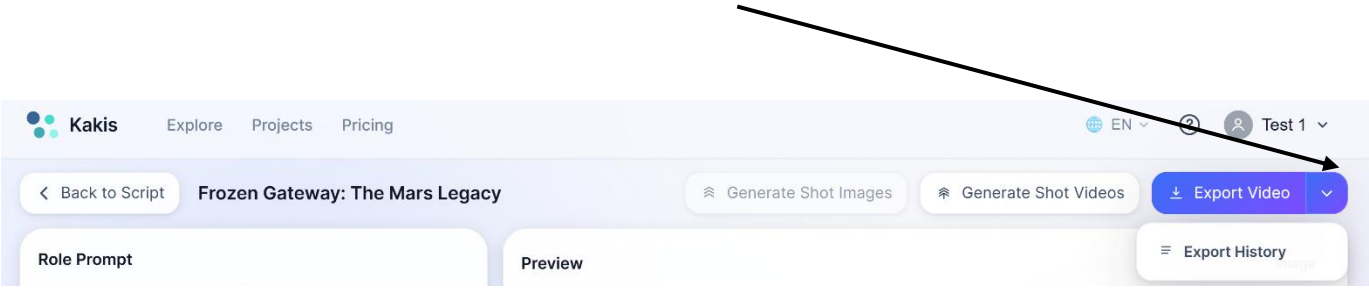
Once satisfied with the script and individual shot assets, you can click "Generate Shot Videos" to compile all the individual shots into a complete video sequence.



2. Exporting the Video

The final step involves exporting the completed video. The "Export Video" option allows you to download their creation in a suitable format for sharing or further use.





You can view your export history of a project here.
